

How to Deploy - Step by Step

Version: unknown
Author: Carlos R.
Date: 2024-03-01
Status: INFORMAL

WARNING: Written by Carlos quickly before his holiday. Not reviewed. May be incomplete.

Steps (as I remember them)

1. SSH into the bastion host (ask DevOps for IP, it changes)
2. Run the deploy script: `./scripts/deploy.sh prod`
 - If it fails, try running it again (known flakiness)
3. Check CloudWatch logs for errors
4. Ping #dev-alerts Slack channel to confirm

Common Issues

- + 'Permission denied' - you probably need to re-assume the IAM role
- + Script hangs at step 3 - kill and retry, usually fine
- + Database migration fails - DO NOT retry, call Carlos

Rollback

There is a rollback script somewhere. Ask DevOps.
